

ELEC3225 Applied Programming Concepts

Assignment #2

Micah Rieley

GroupMates: Regis Lach, Billy Hingston, Jared Hiller

For Billy –

- Waterfall
 - I would expand a bit more on the Implementation and unit testing, the integration and system testing and the operation and maintenance section of the report. For example, instead of just saying integrate components and test them, maybe expand on how each user type may have unique interactions with each other such as admins adding and removing courses which could affect the users or professors.
- Incremental Development
 - I like how you added each section of the user as different versions, the only thing I would say is that it may complicate things by having a fully flushed out version of the student created and then create a full version of the professor and then the admin. It could complicate things as for some interactions, instead of creating simple interactions first and then making them more advanced, you'd just start by creating an advanced version which may make things a bit more difficult
- Integration and Configuration
 - Overall, I agree with what you wrote, the only thing is maybe expand on how the SQL lite server is being implemented and what resources/sites are being used
